MANAGED HOSTING

# OVERVIEW

First and foremost, we appreciate your interest in our business. Swift Host is pioneering a new hosting business that demands partners rather than providers. Years in the data management business have taught us that businesses are taking a new approach to managing their IT. Many business are adopting the internet in every facet of their company to improve their operations, the down side is most providers offer unmanaged solutions, because of this data retention, ownership and security are compromised. We have worked with clients who in past have been "pigeon hold" and "fear mongered" into a "total control" situation from their provider. We believe this approach to be bad business and not transparent. Our goal is educate, develop and produce solutions that give businesses the freedom to make proper decisions

Our goal is to partner with a client to create their required application environment and build it for them providing documentation, recommendations and independent recovery situations.

# CORE BUSINESS

Application Infrastructure can be any web or server based environment that we provision and configure in our data centres to host your applications (the cloud). We then work with our clients to build an environment that matches their requirements. We host Intranets, websites, accounting systems and much more.

## OUR METHOD

Most clients don't understand or have specifications for their application requirements, each situation is different and in order to give the best cost and best plan we have to take this approach.

Using our "On Growth Demand" we slowly create your System sphere over time, adding and adjusting infrastructure resources to match the usage. The costs are typically broken into three categories; server costs, support costs & software license costs.

# OUR PROCESS

## INITIAL MEETING

Either in person or virtual we will discuss your requirements and what your looking to improve.

## PROVISION BASE SERVER

Provision your basic server based on requirements from meeting.

## CONFIGURATION

Setup and configure your application based on your requirements.

## DEVELOPMENT

Our infrastructure technicians will develop your infrastrucutre so we can begin hosting your applications

## DOCUMENTATION

We will provide documentation based on your application and infrastructure, and disaster recovery situation

## LAUNCH

Launch your infrastructure and migrate your application, employees and system

## SUPPORT

Support and maintain your systems and prepare emergency disaster recovery documentation

## FEATURES

- Dedicated IP Address
- DDoS Prevention
- ESXI Access
- Uptime Monitoring
- SSD Hard Drives
- On Growth Demand
- Account Manager
- Documentation

# WHAT DOES IT COST?

Using our On Growth Demand service our pricing scales based on requirement. This allows us to break down our costs into three categories;

## 1. Server/Infrastructure Costs

- Number of Processor cores
- Amount of Memory
- Amount of Harddrive space
- Number of Back up Locations

## 2. Support & Development Costs

- Infrastructure Configuration
- Application Configuration
- Security Modelling
- Documentation Creation

## 3. Software & Licenses

- Application License Costs
